1. *Proposed by Robert E. Kennedy and Curtis Cooper, Central Missouri State University, Warrensburg, Missouri.*

Let $n \geq 2$ and

$$\sum_{j=1}^{i+1} a_{ij} = 0 \quad \text{for } i = 1, 2, \dots, n-1.$$

Find the determinant of the $n \times n$ matrix

$$\begin{pmatrix} a_{11} & a_{12} & 0 & 0 & \dots & 0 & 0 \\ a_{21} & a_{22} & a_{23} & 0 & \dots & 0 & 0 \\ a_{31} & a_{32} & a_{33} & a_{34} & \dots & 0 & 0 \\ a_{41} & a_{42} & a_{43} & a_{44} & \dots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ a_{n-1,1} & a_{n-1,2} & a_{n-1,3} & a_{n-1,4} & \dots & a_{n-1,n-1} & a_{n-1,n} \\ 0 & 0 & 0 & 0 & \dots & 0 & 1 \end{pmatrix}.$$

I. *Solution by Russell Euler, Northwest Missouri State University, Maryville, Missouri.*

Using the given summation constraints, one can column reduce the given matrix, A , to a lower triangular matrix having main diagonal entries

$$a_{11}, a_{21} + a_{22}, a_{31} + a_{32} + a_{33}, \dots, a_{n-1,1} + a_{n-1,2} + \dots + a_{n-1,n-1}.$$

Using the constraints again, these diagonal entries can be replaced by

$$-a_{12}, -a_{23}, -a_{34}, \dots, -a_{n-1,n}$$

respectively. Therefore,

$$\det(A) = (-1)^{n-1} a_{12} a_{23} \cdots a_{n-1,n} .$$

II. *Solution by Albert Dixon, The School of the Ozarks, Point Lookout, Missouri.*

Let

$$B = \begin{pmatrix} 1 & 1 & 1 & 1 & \dots & 1 & 1 \\ 0 & 1 & 1 & 1 & \dots & 1 & 1 \\ 0 & 0 & 1 & 1 & \dots & 1 & 1 \\ 0 & 0 & 0 & 1 & \dots & 1 & 1 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & \dots & 1 & 1 \\ 0 & 0 & 0 & 0 & \dots & 0 & 1 \end{pmatrix}$$

and let A be the matrix above. Then the matrix $C = AB$ (using the given constraints twice) is a lower triangular matrix whose entries along the diagonal can be written as

$$c_{i,i} = -a_{i,i+1} \text{ for } 1 \leq i \leq (n-1) \text{ and } c_{n,n} = 1 .$$

Finally, $\det(AB) = \det(A) \det(B)$ for all matrices A and B and since B is upper triangular while C is lower triangular, their respective determinants are simply the product of their diagonal entries. Therefore, we conclude that

$$\begin{aligned} \det(A) &= \det(A) \cdot 1 \\ &= \det(A) \cdot \det(B) \\ &= \det(AB) \\ &= \det(C) \\ &= (-1)^{n-1} \prod_{i=1}^{n-1} a_{i,i+1} . \end{aligned}$$

2. *Proposed by Curtis Cooper and Robert E. Kennedy, Central Missouri State University, Warrensburg, Missouri.*

A pitcher faces a batter in an at-bat. Let b be the probability the pitch is a ball, w , the probability the batter swings and misses (wiffs), and f , the probability the batter hits a foul ball. What is the probability that the batter strikes out?

Solution by Charles J. Allard, Polo R-VII High School, Polo, Missouri.

The batter will strike out by wiffing after the count reaches two strikes. This ranges from wiffing on an 0-2 count to wiffing with a full count (3-2). This is further complicated by the fact that after two strikes the batter may foul off zero or more pitches without changing the count. Let N represent the event of fouling-off zero or more pitches with two strikes. The sum of the probabilities for event N is

$$1 + f + f^2 + \dots = \frac{1}{1 - f} .$$

Let S represent the event of either wiffing or fouling-off a pitch with less than two strikes. The probability that event S can happen is $w + f$. Furthermore, let B represent the event of taking a ball and W represent the event of wiffing.

A batter can strike out from an 0-2 count with the sequence of events

1	2	3
S	S	N
		W

The probability that the batter strikes out from an 0-2 count is

$$(w + f)^2 w \frac{1}{1 - f} .$$

A batter can strike out from a 1-2 count with the 3 sequences of events

1	2	3	4
<i>B</i>	<i>S</i>	<i>S</i>	<i>N</i> <i>W</i>
<i>S</i>	<i>B</i>	<i>S</i>	<i>N</i> <i>W</i>
<i>S</i>	<i>S</i>	<i>N</i>	<i>B</i> <i>N</i> <i>W</i>

The probability that the batter strikes out from a 1-2 count is

$$(w + f)^2 bw \left(\frac{2}{1 - f} + \frac{1}{(1 - f)^2} \right) .$$

A batter can strike out from a 2-2 count with the 6 sequences of events

1	2	3	4	5
<i>B</i>	<i>B</i>	<i>S</i>	<i>S</i>	<i>N</i> <i>W</i>
<i>B</i>	<i>S</i>	<i>B</i>	<i>S</i>	<i>N</i> <i>W</i>
<i>S</i>	<i>B</i>	<i>B</i>	<i>S</i>	<i>N</i> <i>W</i>
<i>B</i>	<i>S</i>	<i>S</i>	<i>N</i>	<i>B</i> <i>N</i> <i>W</i>
<i>S</i>	<i>B</i>	<i>S</i>	<i>N</i>	<i>B</i> <i>N</i> <i>W</i>
<i>S</i>	<i>S</i>	<i>N</i>	<i>B</i>	<i>N</i> <i>W</i>

The probability that the batter strikes out from a 2-2 count is

$$(w + f)^2 b^2 w \left(\frac{3}{1 - f} + \frac{2}{(1 - f)^2} + \frac{1}{(1 - f)^3} \right) .$$

Finally, a batter can strike out from a 3-2 count with the 10 sequences of events

1	2	3	4	5	6				
S	B	B	B	S	N	W			
B	S	B	B	S	N	W			
B	B	S	B	S	N	W			
B	B	B	S	S	N	W			
S	B	B	S	N	B	N	W		
B	S	B	S	N	B	N	W		
B	B	S	S	N	B	N	W		
S	B	S	N	B	N	B	N	W	
B	S	S	N	B	N	B	N	W	
S	S	N	B	N	B	N	B	N	W

The probability that the batter strikes out from a 3-2 count is

$$(w + f)^2 b^3 w \left(\frac{4}{1-f} + \frac{3}{(1-f)^2} + \frac{2}{(1-f)^3} + \frac{1}{(1-f)^4} \right).$$

Adding these probabilities up, we get the probability that the batter strikes out is

$$\begin{aligned} & \sum_{i=0}^3 (w + f)^2 b^i w \sum_{j=0}^i \frac{i+1-j}{(1-f)^{j+1}} \\ &= \frac{(w + f)^2 w}{(1-f)^4} \sum_{i=0}^3 \sum_{j=0}^i b^i (i+1-j) (1-f)^{3-j} \\ &= \frac{(w + f)^2 w}{(1-f)^4} \sum_{j=0}^3 \sum_{i=j}^3 b^i (i+1-j) (1-f)^{3-j} \\ &= \frac{(w + f)^2 w}{(1-f)^4} \sum_{j=0}^3 \sum_{i=0}^{3-j} b^{i+j} (i+1) (1-f)^{3-j} \\ &= \frac{(w + f)^2 w}{1-f} \sum_{j=0}^3 \left(\frac{b}{1-f} \right)^j \sum_{i=0}^{3-j} (i+1) b^i. \end{aligned}$$

Also solved by the proposers.
