Mersenne Numbers

- A Mersenne number is a number of the form $2^{p} 1$, where *p* is a prime number.
- Examples of Mersenne numbers are:

$$M2 = 3 = 22 - 1$$

$$M3 = 7 = 23 - 1$$

$$M5 = 31 = 25 - 1$$

$$M7 = 127 = 27 - 1$$

$$M11 = 2047 = 211 - 1$$

Marin Mersenne				

- Mersenne compiled what was supposed to be a list of Mersenne primes with exponents up to 257.
- His list was largely incorrect, as Mersenne mistakenly included M67 and M257 (which are composite), and omitted M61, M89, and M107 (which are prime).

Lucas-Lehmer Test

Let p be a prime number. Then

 $M_p = 2^p - 1$ is prime if and only if $S_{p-1} \mod M_p = 0.$

If M_p is prime, then p is prime.

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のへで

Curtis Cooper University of Central Missouri

Mersenne Primes	History of Mersenne Primes	48th Mersenne Prime	GIMPS	Lucas-Lehmer Test and Fast Fourier Transf
00	00			
	0000			

If M_p is prime, then p is prime.

Proof

By contradiction. Suppose p is composite. Then p = ab for some a, b > 1. But then

$$\begin{aligned} 2^p - 1 &= 2^{ab} - 1 = (2^a)^b - 1 \\ &= (2^a - 1) \cdot (2^{a(b-1)} + 2^{a(b-2)} + \dots + 2^a + 1). \end{aligned}$$

э.

Since the last two factors are both greater than 1, $2^{p} - 1$ is composite, a contradiction.

Perfect Number Theorem

Theorem

An even positive integer n is perfect if and only if there exists a positive integer p such that $2^{p} - 1$ is prime and $n = 2^{p-1} \cdot (2^{p} - 1)$.

	00 00 0000		00 0 0	00000000 0

Proof

(\Leftarrow) Let $n = 2^{p-1} \cdot (2^p - 1)$, where $2^p - 1$ is prime. Since 2^{p-1} and $2^p - 1$ are relatively prime, the sum of the divisors of *n* is equal to the sum of the divisors of 2^{p-1} times the sum of the divisors of 2^{p-1} is

$$1 + 2 + \dots + 2^{p-2} + 2^{p-1} = 2^p - 1$$

and the sum of the divisors of $2^p - 1$ is 2^p , since $2^p - 1$ is prime. And the product is

$$(2^{p}-1) \cdot 2^{p} = 2 \cdot 2^{p-1}(2^{p}-1) = 2n.$$

・ロ・・ (日・・ ほ・・ (日・)

So the sum of the proper divisors of *n* is *n* and *n* is perfect.
