## Definition - Generalized Lucas Integral Sequence of Order $k \geq 1$ - Bisht (1984)

Let $n$ be a nonnegative integer and

$$
G_{n}=x_{1}^{n}+x_{2}^{n}+\cdots+x_{k}^{n},
$$

where $x_{1}, x_{2}, \ldots, x_{k}$ are the roots of the equation

$$
x^{k}=a_{1} x^{k-1}+a_{2} x^{k-2}+\cdots+a_{k}
$$

with integral coefficients and $a_{k} \neq 0$.

The generalized Lucas integral sequence of order 2 with equation $x^{2}=x+1$ is the Lucas sequence.

The generalized Lucas integral sequence of order 2 with equation $x^{2}=x+1$ is the Lucas sequence.

Perrin's sequence is the generalized Lucas integral sequence of order 3 with $a_{1}=0, a_{2}=1$, and $a_{3}=1$. Perrin's sequence (Sloane - A001608) is defined as $G_{0}=3, G_{1}=0, G_{2}=2$, and

$$
G_{n}=G_{n-2}+G_{n-3} \text { for } n \geq 3
$$

## $G_{n}$ 's in terms of the $a_{i}$ 's (Newton's Formulas) - Bisht (1984)

$$
\begin{array}{ll}
G_{0}=k, & \\
G_{n}=\sum_{j=1}^{n-1} a_{j} G_{n-j}+n a_{n}, & \text { if } n=1,2, \ldots, k-1, \\
G_{n}=\sum_{j=1}^{k} a_{j} G_{n-j}, & \text { if } n \geq k .
\end{array}
$$

# Using the Girard-Waring formula we have the following closed form. 

Curtis Cooper and Lawrence Somer
Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ Sequences and Pseudoprimes

Using the Girard-Waring formula we have the following closed form.

## Closed Form

Let $\left\{G_{n}\right\}$ be a generalized Lucas integral sequence and $n$ be a positive integer. Then

$$
G_{n}=n \cdot \sum_{\substack{i_{1}+2 i_{2}+\cdots+k_{k}=n \\ i_{1}, i_{2}, \ldots, i_{k} \geq 0}} \frac{\left(i_{1}+i_{2}+\cdots+i_{k}-1\right)!}{i_{1}!i_{2}!\cdots i_{k}!} a_{1}^{i_{1}} a_{2}^{i_{2}} \cdots a_{k}^{i_{k}} .
$$

## Theorem 1 - Bisht

Let $\left\{G_{n}\right\}$ be a generalized Lucas integral sequence of order $k \geq 1$ and $p$ be a prime number. Then

$$
G_{p} \equiv G_{1} \quad(\bmod p)
$$

## Theorem 1 -Bisht

Let $\left\{G_{n}\right\}$ be a generalized Lucas integral sequence of order $k \geq 1$ and $p$ be a prime number. Then

$$
G_{p} \equiv G_{1} \quad(\bmod p) .
$$

## Theorem 2 - Bisht

Let $\left\{G_{n}\right\}$ be a generalized Lucas integral sequence of order $k \geq 1$ and $p$ be a prime number. Then, for positive integers $m$ and $r$,

$$
G_{m p^{r}} \equiv G_{m p^{r-1}} \quad\left(\bmod p^{r}\right) .
$$

Hoggatt and Bicknell (1974) proved that if $p$ is prime, then $L_{p} \equiv L_{1}(\bmod p)$.

Hoggatt and Bicknell (1974) proved that if $p$ is prime, then $L_{p} \equiv L_{1}(\bmod p)$.

Lucas (1878) studied Perrin's sequence and proved that if $p$ is prime, then $G_{p} \equiv G_{1}(\bmod p)$.

# During their study of Perrin's sequence, Adams and Shanks (1982) extended Perrin's sequence to negative indices and proved that $G_{-p} \equiv G_{-1}(\bmod p)$ when $p$ is prime. 

During their study of Perrin's sequence, Adams and Shanks (1982) extended Perrin's sequence to negative indices and proved that $G_{-p} \equiv G_{-1}(\bmod p)$ when $p$ is prime.

We wish to extend the definition of a generalized Lucas integral sequence of order $k \geq 1$ to negative indices so that

$$
G_{n}=x_{1}^{n}+x_{2}^{n}+\cdots+x_{k}^{n}
$$

is true for negative integers $n$.

During their study of Perrin's sequence, Adams and Shanks (1982) extended Perrin's sequence to negative indices and proved that $G_{-p} \equiv G_{-1}(\bmod p)$ when $p$ is prime.

We wish to extend the definition of a generalized Lucas integral sequence of order $k \geq 1$ to negative indices so that

$$
G_{n}=x_{1}^{n}+x_{2}^{n}+\cdots+x_{k}^{n}
$$

is true for negative integers $n$.
In the meantime, we want these $G_{n}$ 's to be integers. One way to do this is to let $a_{k}=1$.

## Therefore, we define $G$ for negative indices as follows:

$$
\begin{aligned}
& G_{0}=k, \\
& G_{-n}=-\sum_{j=1}^{n-1} a_{k-j} G_{-n+j}-n a_{k-n}, \quad \text { if } n=1,2, \ldots, k-1, \\
& G_{-n}=-\sum_{j=1}^{k-1} a_{k-j} G_{-n+j}+G_{-n+k}, \quad \text { if } n \geq k .
\end{aligned}
$$

Therefore, we define $G$ for negative indices as follows:

$$
\begin{aligned}
& G_{0}=k, \\
& G_{-n}=-\sum_{j=1}^{n-1} a_{k-j} G_{-n+j}-n a_{k-n}, \quad \text { if } n=1,2, \ldots, k-1, \\
& G_{-n}=-\sum_{j=1}^{k-1} a_{k-j} G_{-n+j}+G_{-n+k}, \quad \text { if } n \geq k .
\end{aligned}
$$

We call these generalized Lucas integral sequences of order $k \geq 1$ with $a_{k}=1$ that are defined for negative indices Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ sequences.

## Definition

Let $\left\{G_{n}\right\}$ be a Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ sequence. A composite $n$ such that

$$
G_{n} \equiv G_{1} \quad(\bmod n)
$$

and

$$
G_{-n} \equiv G_{-1} \quad(\bmod n)
$$

is called a Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ pseudoprime.

Is the set of Lucas $(0,2,1)$ pseudoprimes equal to the set of Lucas ( $1,0,1,1$ ) pseudoprimes?

## Question 1

Is the set of Lucas $(0,2,1)$ pseudoprimes equal to the set of Lucas ( $1,0,1,1$ ) pseudoprimes?

The key to looking at this question is the characteristic polynomials of these sequences.

## Characteristic Polynomials

Lucas $(1,1)$ sequence: $x^{2}-x-1$.

Curtis Cooper and Lawrence Somer
Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ Sequences and Pseudoprimes

## Characteristic Polynomials

Lucas $(1,1)$ sequence: $x^{2}-x-1$. Lucas $(0,2,1)$ sequence: $x^{3}-2 x-1=\left(x^{2}-x-1\right)(x+1)$.

## Characteristic Polynomials

> Lucas $(1,1)$ sequence: $x^{2}-x-1$ Lucas $(0,2,1)$ sequence: $x^{3}-2 x-1=\left(x^{2}-x-1\right)(x+1)$. Lucas $(1,0,1,1)$ sequence: $x^{4}-x^{3}-x-1=\left(x^{2}-x-1\right)\left(x^{2}+1\right)$

## Characteristic Polynomials

> Lucas $(1,1)$ sequence: $x^{2}-x-1$ Lucas $(0,2,1)$ sequence: $x^{3}-2 x-1=\left(x^{2}-x-1\right)(x+1)$. Lucas $(1,0,1,1)$ sequence: $x^{4}-x^{3}-x-1=\left(x^{2}-x-1\right)\left(x^{2}+1\right)$

Lucas ( $0,1,2,1$ ) sequence:
$x^{4}-x^{2}-2 x-1=\left(x^{2}-x-1\right)\left(x^{2}+x+1\right)$.

## Characteristic Polynomials

Lucas $(1,1)$ sequence: $x^{2}-x-1$.
Lucas $(0,2,1)$ sequence: $x^{3}-2 x-1=\left(x^{2}-x-1\right)(x+1)$.
Lucas ( $1,0,1,1$ ) sequence:
$x^{4}-x^{3}-x-1=\left(x^{2}-x-1\right)\left(x^{2}+1\right)$.
Lucas ( $0,1,2,1$ ) sequence:
$x^{4}-x^{2}-2 x-1=\left(x^{2}-x-1\right)\left(x^{2}+x+1\right)$.
Observe that in each case, the characteristic polynomial of the Lucas $(0,2,1),(1,0,1,1)$, or $(0,1,2,1)$ sequence is equal to the characteristic polynomial of the Lucas $(1,1)$ sequence multiplied by a cyclotomic polynomial.

## Theorem 5

Suppose that the characteristic polynomial of a Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ sequence is equal to the characteristic polynomial of a Lucas $\left(b_{1}, b_{2}, \ldots, b_{r}=1\right)$ sequence multiplied by $j$ polynomials, each of which is a cyclotomic polynomial of order $m_{1}, m_{2}, \ldots, m_{j}$, respectively. Assume that the characteristic polynomial of the Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ sequence has no repeated roots. Let $m=\operatorname{lcm}\left(m_{1}, m_{2}, \ldots, m_{j}\right)$. Then each Lucas $\left(b_{1}, b_{2}, \ldots, b_{r}=1\right)$ pseudoprime which is relatively prime to $m$ is a Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ pseudoprime.

## Theorem 5

Suppose that the characteristic polynomial of a Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ sequence is equal to the characteristic polynomial of a Lucas $\left(b_{1}, b_{2}, \ldots, b_{r}=1\right)$ sequence multiplied by $j$ polynomials，each of which is a cyclotomic polynomial of order $m_{1}, m_{2}, \ldots, m_{j}$ ，respectively．Assume that the characteristic polynomial of the Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ sequence has no repeated roots．Let $m=\operatorname{lcm}\left(m_{1}, m_{2}, \ldots, m_{j}\right)$ ． Then each Lucas（ $b_{1}, b_{2}, \ldots, b_{r}=1$ ）pseudoprime which is relatively prime to $m$ is a Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ pseudoprime．

Since there are no even Lucas $(1,1)$ pseudoprimes and since $x+1$ and $x^{2}+1$ are cyclotomic polynomials of orders 2 and 4 ， respectively，all Lucas $(1,1)$ pseudoprimes are both Lucas $(0,2,1)$ pseudoprimes and Lucas $(1,0,1,1)$ pseudoprimes．

## Question 2

Is the set of Lucas $(0,2,0,1)$ pseudoprimes equal to the set of Lucas ( $0,4,0,1$ ) sequences?

## Question 2

Is the set of Lucas $(0,2,0,1)$ pseudoprimes equal to the set of Lucas ( $0,4,0,1$ ) sequences?

## Theorem 6

The Lucas $\left(0, a_{2}, 0,1\right)$ pseudoprimes are precisely the odd composite natural numbers and the even integers $2 m \geq 4$ for which $m \mid G_{m}\left(a_{2}, 1\right)$.

## Question 2

Is the set of Lucas $(0,2,0,1)$ pseudoprimes equal to the set of Lucas ( $0,4,0,1$ ) sequences?

## Theorem 6

The Lucas $\left(0, a_{2}, 0,1\right)$ pseudoprimes are precisely the odd composite natural numbers and the even integers $2 m \geq 4$ for which $m \mid G_{m}\left(a_{2}, 1\right)$.

Lawrence Somer gives comprehensive criteria for determining when $n \mid G_{n}\left(a_{1}, 1\right)$, which relates to Theorem 6.

## The answer to Question 2 is no.

Curtis Cooper and Lawrence Somer
Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ Sequences and Pseudoprimes

The answer to Question 2 is no.

The first composite even integers which are Lucas $(0,2,0,1)$ pseudoprimes and not Lucas ( $0,4,0,1$ ) pseudoprimes are 132, 396, and 1188.

The answer to Question 2 is no.

The first composite even integers which are Lucas $(0,2,0,1)$ pseudoprimes and not Lucas ( $0,4,0,1$ ) pseudoprimes are 132, 396, and 1188.

The first composite even integer which is a Lucas ( $0,4,0,1$ ) pseudoprime and not a Lucas ( $0,2,0,1$ ) pseudoprime is 1284.

## Question 3

For every $k \geq 2$, is there a $k$-tuple $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ such that there are an infinite number of Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ pseudoprimes?

## Question 3

For every $k \geq 2$, is there a $k$-tuple $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ such that there are an infinite number of Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ pseudoprimes?

The answer is yes.

## Question 4

Is there a Lucas $(0,1,1)$ pseudoprime?

Curtis Cooper and Lawrence Somer
Lucas $\left(a_{1}, a_{2}, \ldots, a_{k}=1\right)$ Sequences and Pseudoprimes

## Question 4

Is there a Lucas $(0,1,1)$ pseudoprime?
The answer to this question is unknown. Composite $n$ up to $10^{7}$ have been checked and so far, no Lucas $(0,1,1)$ pseudoprimes have been found. If such an example exists, we suspect it will be very large.
